Supplemental Material

Time-Series Analysis of Heat Waves and Emergency Department Visits in Atlanta, Georgia, 1993 to 2012

Tianqi Chen, Stefanie Ebel Sarnat, Andrew J. Grundstein, Andrea Winquist, and Howard H. Chang

Table of Contents

Table S1. The concordance-discordance between heat wave metrics in Atlanta, 1993-2012.

Table S2. Relative risk estimates and 95% confidence intervals of associations of heat wave days compared to non-heat wave days for emergency department visits for all 17 health outcomes.

Table S3. Relative risk estimates and 95% confidence interval for emergency department visits in relation to the order of heat wave day defined using maximum or minimum temperature.

Table S4. Relative risk estimates and 95% confidence interval for emergency department visits in relation to the order of heat wave periods within a year defined using maximum or minimum temperature.

Table S5. Relative risk estimates and 95% confidence interval for emergency department visits associated with per 1°C increase in average temperature during heat waves.

Figure S1. Estimated relative risks and 95% confidence intervals for ED visits associated with lag 0 heat wave days compared to non-heat wave days, controlling for different continuous temperature metrics.

Figure S2. Estimated relative risks and 95% confidence intervals for ED visits associated with lag 0 and lag 1 heat wave days compared to non-heat wave days, controlling for different continuous dew-point temperature and relative humidity metrics.
